Most fatalities and serious accidents occur at mine sites while miners are moving materials, whether by mobile equipment, conveyor belt, or other specialized equipment.

Technology such as back-up cameras, collision warning systems and interlocking seat belts can help miners avoid PH accidents, but they are not fail-safe. Miners still need to pay attention. Lack of visibility and communication are direct causes of accidents that equipment operators must know.

**Basic Hauling Safety Tips:**

- **Let others know you when you enter their work area**
- **Wear the seat belt in the equipment**
- **Set wheel chocks on parked equipment**
- **Follow traffic rules for speed limits and such, and pay attention to signs for STOP, CAUTION, YIELD, etc.**
- **If mobile equipment has technology, use it, but recognize it is not a substitute for human attention.**
